BQ465952 660 bp . mRNA linear BST 30-MAY-2002 HT01C12T HT Hordeum vulgare subsp. vulgare cDNA clone HT01C12 5-FRYBE, mENA sequence. BQ465952. GI:21273734
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              /clone lib="HT"
/note="Vector: pBluescript SK+; Site 1: EcoRI (5'-end of CDNA); Due to a cloning artefact caused by the kit, in most cases the EcoRI site is NOT present, as well as the EcoRIadapter used for cloning. To excise the insert, restriction sites upstream EcoRI should be used (e.g. bamHI, SalI,PStI). NOTE: Also due to the cloning system used Blue/white selection for recombinats is not 100% reliable.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Hordeum vulgare subsp. vulgare

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             /note==Vector: plasmid pBK-CMV; Site 1: EcoRI; Site 2:
Xho1; mRNA was made from developing caryopsis (3.-15_DAP)
of spring barley variety 'Barke', a high quality malting
variety. Cloning sites: EcoRI (5'-end of cDNA) and XhoI
(3'-end of cDNA). NOTE: Due to a cloning artefact caused
by the kit, in most cases the RocoRI site is NOT present,
as well as the EcoRI adapter. Average insert size is 1 kb
Sequence trimming: Vector sequences and sequence ends were
trimmed from the 5'-and 3'-end until a 50 bp window
contains less than two ambiguities. The maximum length was
set to 700 bp"
                                                                                                                                                                                                                                                                                                    EST 04-JAN-2001

Pred. No. is the number of results predicted by chance to have a

score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Sequencing vector: Plasmid, pUC18
Chemistry: Dye-terminator Big Dye
Assembly program: Phrasy version 0.990329.
**NOTE: This is a 'working draft' sequence. It currently
consists of I a contigs. Gaps between the contigs
* are represented as runs of N. The order of the pieces
* is believed to be correct as given, however the sizes
* of the gaps between them are based on estimates that have
* provided by the submittor.
* This sequence will be replaced
* by the finished sequence as soon as it is available and
* the accession number will be preserved.
* 1187 contig of 1187 bp in length
* 12635 12734; gap of unknown length
* 12635 12734; gap of unknown length
* 16457 16556; gap of unknown length
* 1657 26480; contig of 9224 bp in length
* 26580; 28999; contig of 1318 bp in length
* 26580; gap of unknown length
* 26580; gap of unknown length
* 26580; contig of 597 bp in length
* 26580; contig of 1318 bp in length
* 26590; contig of 587 bp in length
* 26590; contig of 587 bp in length
* 2650; contig of 587 bp in length
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The order-orientation of the draft sequence was accomplished by
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        This sequence has been compared to sequences of other species using Vista (http://www-gsd.lbl.gov/VISTA). The results can be
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Avid (http://baboon.math.berkeley.edu/mavid),

Cambridgeshire, CB10 18A, UK. E-mail enquiries:
Inumquery@sanger.ac.uk Clone requests: clonerequest@sanger.ac.uk
On Nov 2, 1998 this sequence version replaced gi:3550020.
During sequence assembly data is compared from overlapping clones.
Where differences are found these are annotated as variations together with a note of the overlapping clone name. Note that the variation annotation may not be found in the sequence submission corresponding to the overlapping clone, as we submit sequences with only a small overlap as described above.
The following abbreviations are used to associate primary accession numbers given in the feature table with their source databases:
Ems. EMBL; Sw: SWISSPROT; IT: TRENBL; WP: WORMPEP; Information on the WORMPEP database can be found at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                hann DNA linear FRI 05-JUN-2003
Human DNA sequence from clone RPS-117715 on chromosome 22g13.1
Contains a novel gene, the MSE55 gene for serum constituent protein
MSE55, the LGALS2 gene for soluble Galactose-binding Lectin 2
(Galactin 2, S-Lac Lectin 2, HJ14), ESTS, an STS, GSSS and two
putative CpG islands, complete sequence.
                                                                                                                                                                                                                                                                                                                /evidenceeexperimental

This sequence was finished as follows unless otherwise noted: all regions were either double-stranded or sequenced with an alternate chemistry or covered by high quality data (i.e., phred quality) = 30); an attempt was made to resolve all sequencing problems, such as compressions and repeats; all regions were covered by at least one plasmid subclone or more than one M13 subclone; and the assembly was confirmed by restriction M13 subclone; and the assembly was confirmed by restriction migest, except on the rare occasion of the clone being a MAC.

This sequence was generated from part of bacterial clone contigs of human chromosome 22, constructed by the Sanger Centre Chromosome 22 http://www.sanger.ac.uk/HGP/Chr22 constructed by the group of RP5-117715 is from the library RPCI-5 constructed by the group of http://www.chori.org/bacpac/home.htm

                                                                                                                                                                                                                                        NOTICE: This sequence may not represent the entire insert of this clone. It may be shorter because we only sequence overlapping clone sections once, or longer because we provide a small overlap between neighboring data submissions.
                                                                                                                                                                                                                                                                                                                                                                                                                         all regions were double stranded, sequenced with an alternate chemistry, or covered by high quality data (i.e., phred quality >= 30); an attempt was made to resolve all sequencing problems, such as compressions and repeats; all regions were covered by sequence from more than one subclone; and the assembly was confirmed by restriction digest.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  sapiens EST AI651841 (NID:94735820)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Mapping information for this clone was provided by Dr. John D. McPherson. Department of Genetics, Washington University, St. Louis MO. For additional information about the map position of this sequence, see http://genome.wustl.edu/gsc
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                NOTICE: This sequence may not represent the entire insert of this clone. It may be shorter because we only sequence overlapping clone sections once, or longer because we provide a small overlap between neighboring data submissions.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  This sequence was finished as follows unless otherwise noted: all regions were double stranded, sequenced with an alternate chemistry, or covered by high quality data (i.e., phred quality >= 30); an attempt was made to resolve all sequencing problems, such as compressions and repeats; all regions were covered by sequence from more than one subclone; and the assembly was confirmed by
                                                                                             Enkaryogica, Metazoa, Chordata, Craniata, Vertebrata, Euteleostomi, Mammalia, Eutheria, Primates, Catarrhini, Hominidae, Homo.

                                                                                                                                                                                                                                                                                                                                                                                                                                      NOTE: This is a 'working draft' sequence. It currently consists of 14 contigs. The true order of the pieces is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will be preserved.

consists of 3 contigs. The true order of the pieces is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will be preserved.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Query Match

Submitted (20-NOV-2002) Human Genome Sequencing Center, Department of Molecular and Human Genetics, Baylor College of Medicine, One Baylor Plaza, Houston, TX 77030, USA

On Nov 20, 2002 this sequence version replaced gi:23907725.

The sequence in this assembly is a combination of BAC based reads and whole genome shotgun sequencing reads assembled using Atlas (http://www.hgsc.bcm.tmc.edu/projects/rat/). Each contig described in the Eature table below represents a scaffold in the Atlas assembly (a 'contig-scaffold'). Within each contig-scaffold, by sized gaps filled with Ns to the estimated size. The sequence may extend beyond the ends of the clone and there may be sequence contigs within a contig-scaffold that consist entirely of whole genome shotgun sequence reads. Both end sequences and whole genome shotgun sequence reads. Both end sequences and whole genome shotgun sequence reads. Both end sequences and whole genome table.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Submitted (18-MAY-2002) Human Genome Sequencing Center, Department of Molecular and Human Genetics, Baylor College of Medicine, One Baylor Plaza, Houston, TX 77030, USA 3 (bases 1 to 235785)

                                                 NOTE: Estimated insert size may differ from sequence length (see http://www.ngsc.bcm.tmc.edu/docs/Genbank draft data.html).
NOTE: This is a 'working draft' sequence. It currently consists of 3 contigs. The true order of the pieces is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will be preserved.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ô

Generating mature dendritic cells for tumor immunotherapy or as vaccines for activating the immune system to treat diseases such as cancer, comprises contacting a dendritic cell precursor with a D type oligodeoxynucleotide.

Disclosure, Page 26; 69pp, English.

The present sequence is that of a D type CpG oligodeoxynucleotide that is an example of claimed D type oligodeoxynucleotides (see ACC48294) of the

invention. Mature dendritic cells are obtained by contacting a dendritic cell precursor, such as a monocyte, with such an oligodeoxymucleotide. The method is useful for generating mature dendritic cells and enhancing T cell responses, thus enhancing antigen presentation. Mature dendritic cells are useful for tumour immunotherapy, for augmenting an immune response to an infectious agent or to a vaccine, and as vaccines to prevent future infection or to activate the immune system to treat diseases such as cancer. Mature dendritic cells may also be used to produce activated I lymphocytes
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The invention relates to human breast cancer expressed polynucleotides (AALO7544-AAL26789) and methods of assessing whether a patient is affilicted with breast cancer by examining the correlation between the expression of certain markers and the cancerous state of breast cells. The polynucleotides and encoded polypeptides are potential markers for detecting, diagnosing, manitoring, characterising treating and potentially preventing breast cancer. The polynucleotides and encoded polypeptides are also useful for isolating compounds with cytostatic
                                                                                                                                                                        Gaps

AAA79263 to AAA79736 and AAB25100 to AAB25570 represent polynuclectide and protein sequences isolated from eucalyptus (Eucalyptus grandis) or pine (Prins radiata also known as Monteev pine). The protein sequences can be used to modify the response of plant cells to external signals. The polynuclectide and protein sequences can be used to modify the response of plant cells to external signals. C e.g. environmental changes or pathogens during the growth and development of a plant. They can be used to modify cell proliferation, differentiation, elongation and survival resistance to disease and intered fruit ripening and senescence of leaves and flowers e.g. to delay senescence and prolong the life of cut flowers or enhance senescence of reproductive organs to engineer sterile plants. Other modifications can be used to delay senescence in selected cell types or organs providing fruit and vegetables which have a longer shelf life between harvest and consumption, or to decrease branching frequency in forest tree species giving long stretches of valuable knot-free clear wood which can be used in solid timber furniture and veneers
                                                                                                                                                                                                                                                                                                    Isolated polynucleotide encoding a polypeptide involved in cell signaling used for generating transgenic plants with modified responses to external
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Plant; bacterial infection; fungal infection; viral infection; rice;

The present invention relates to a method (MI) for identifying genes involved in plant resistance or response to pathogenic infection. MI comprises identifying a gene whose expression is significantly altered in the incompatible interaction of plant gene expression relative to expression of the gene in an uninfected plant, in a mutant plant that does not express a gene associated with response to pathogenic infection, or in a corresponding incompatible or compatible interaction. (MI) is useful for conferring resistance to resistance or tolerance to a plant to bacterial, fungal or viral infection. The present sequence was used to

New isolated polynucleotide encoding a plant transcription factor for producing a plant e.g. a woody plant, preferably eucalyptus or pine, having modified gene expression or modified activity of a polypeptide.

Claim 1; Page 131; 747pp; English

The present invention relates to novel plant transcription factors from bucalyptus grandis or Pinus radiata. The present sequence is the coding sequence for one such transcription factor. The transcription factor may be used to produce a plant having modified gene expression such as a mandgany species or to manylyptus, pine, acacia, poplar sweetgum, teak, or mandgany species or to madify the activity of a polypeptide in a plant. The transcription factors of the present invention are members from the following families of regulatory proteims: bZIP, bZIP family of G-box hondmostic/homeodomain/homeobox/WALDS, homeofomain, zipper, LIM domain, AP2 and RREBs, zinc finger domains of type 2 Cys2His2, CCAAT box elements and

Examining the ischemic condition (e.g. occlusive ischemia) by measuring expression levels of particular genes defined in the specification or by determining the expression profile of a gene group comprising these

Claim 2; Page 1768-1769; 2690pp; English.

The present invention describes a method for examining ischaemic conditions, comprising measuring the expression levels of particular genes (I) in a test sample or determining the expression profile of a gene group in the sample comprising genes selected from (I). The method is useful for examining the ischaemia or oracition (e.g. compressive ischaemia, occlusive ischaemia or vasocspastic ischaemia) by measuring expression levels of particular genes (ABI99202 to ABI99912, encoding the

process sequences in ABB57020 to ABBS7374) or by determining the expression profile of a gene group comprising these genes. The expression lidicator expression profiles produced by these genes are used as an indicator when screening for ischaemic condition-improving drugs or therapeutics for ischaemic diseases. ABI99913 and ABI99914 represent PCR primers for a mouse ischaemic condition related sequence, which are used in the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention comprises the amino acid and coding sequences of novel proteins. The DNA and protein sequences of the invention are useful as: markers for tissues in which the corresponding protein is preferentially expressed, as molecular weight markers on gels, as chromosome markers or tags, to identify chromosomes or to map related gene positions; and to compare with endogenous DNA sequences in patients to identify potential genetic disorders. The present DNA sequence represents a gene of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         New polynucleotides, useful for expressing recombinant proteins for analysis, characterization or therapeutic use, or as markers for tissues in which the corresponding protein is preferentially expressed.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Novel coding seguence (useful for identifying genetic disorders) #481.

The invention relates to an isolated nucleic acid comprising any one of the fall antisense sequences given in the specification where expression of the nucleic acid inhibits proliferation of a cell. Also included are:

(1) a vector comprising a promoter operably linked to the nucleic acid models a promoter operably linked to the nucleic acid conditions and promoter operably linked to the nucleic acid of the antisense nucleic acid; (2) a host cell containing the vector; (3) an isolated polypeptide or its fragment whose expression is inhibited by the antisense nucleic acid; (4) an antibody capable of specifically binding complypeptide; (5) producing the polypeptide; (6) inhibiting cellular proliferation or the activity of agene in an open product or that has an activity against a biological pathway cellurated for proliferation, or that inhibits cellular proliferation; (8) identifying a gene required for cellular proliferation or the biological correction; (9) pathway in which a proliferation-required gene or its gene product lies correctly against a proliferation of an organism acts; (9) manufacturing an antibiotic; (10) profiling a compound's activity; (11) a culture comprising strains in which the gene compound's activity; (11) a culture comprising strains in which the gene product is overexpressed or underexpressed, (12) determining the extent compound's activity; (13) identifying the target of a compound that inhibits the

proliferation of an organism. The antisense nucleic acids are useful for identifying proteins or screening for homologous nucleic acids required dor cellular proliferation to isolate candidate molecules for rational drug discovery programs, or for screening homologous nucleic acids required for proliferation in cells other than S. aureus, S. typhimurium, F. pneumoniae or P. aeruginosa. The present sequence is one of the target prokaryotic essential genes. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences

```
The present invention relates to novel NOV proteins and their coding sequences (ADD49028-ADD49131). The proteins and coding sequences are useful in the manufacture of a medicament for treating a syndrome associated with a human disease, preferably a NOV-associated disorder (viral, bacterial, fundal, helminthic, and protozoal), anorexia, cancer, cardiovascular diseases (hypertension, atherosclerosis), norexia, cancer, cardiovascular diseases (hypertension, atherosclerosis), newrodegenerative disorders (osteoarthritis), hematopoietic disorders, inflammatory skin disorders, asthma and various dyslipidemias. The coding sequences and proteins may also be used as targets for the identification of small molecules that modulate or inhibit e.g. neurogenesis, cell effect modules that modulate or inhibit e.g. neurogenesis, cell ifferentiation, cell proliferation, hematopoiesis, wound healing and angiogenesis, in gene therapy, in generation of antibodies that bind imunospecifically to NoV substances for use in therapeutic or diagnostic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            t 6
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Identifying at least one gene involved in plant resistance or response pathogenic infection for conferring resistance or tolerance to a plant bacterial, fungal or viral infection by determining or detecting plant gene expression.
                                                                      New isolated NOVX polypeptides and polynucleotides, useful for preventing, diagnosing or treating NOVX-associated disorders, e.g. osteoarthritis, obesity, atherosclerosis, cancer, Parkinson's disease,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps

The present invention relates to a method (M1) for identifying genes involved in plant resistance or response to pathogenic infection. M1 comprises identifying a gene whose expression is significantly altered in the incompatible interaction of plant gene expression relative to expression of the gene in an uninfected plant, in a mutant plant that does not express a gene associated with response to pathogenic infection, or in a corresponding incompatible or compatible interaction. (M1) is bacterial, fungal or viral infection. The present sequence was used to illustrate the invention.

Diagnosing cancer comprises determining the polypeptide or polymucleotide levels e.g., hepatic lipase, in a sample from a subject, where a higher level compared to that in a subject free of cancer is indicative of

Disclosure, SEQ ID NO 311, 272pp; English.

The invention relates to a novel method for diagnosing a cancer in a subject. the method comprises determining, in a sample from the subject, the level of at least one polypeptide, where a higher level of the polypeptide compared to the level of the polypeptide in a subject free of cancer is indicative of cancer. The polypeptide is selected from any of specification and polypeptides which are at least 70% homologous to the polypeptides. The method of the invention has cytostatic activity, and markers specific for one or several types of cancer, depending on the tissue origin, which may be used in numerous diagnostic and prognostic applications as well as cancer type-specific targets for therapeutic

Isolated polynucleotide encoding a polypeptide involved in cell signaling used for generating transgenic plants with modified responses to external signals.

Claim 1; Page 415-416; 527pp; English.

AAA79263 to AAA79736 and AAB25100 to AAB25570 represent polynucleotide and protein sequences isolated from eucalyptus (Bucalyptus grandis) or pine (Pinus radiata also known as Monterey pine). The protein sequences are involved in call signalling. The polynucleotide and protein sequences are involved in call signalling. The polynucleotide and protein sequences can be used to modify the response of plant cells to external signals e.g. environmental changes or pathogens during the growth and development of a plant. They can be used to modify cell proliferation, differentiation, elongation and survival, resistance to disease and nutrient metabolism. Examples of modifications which can be produced are altered fruit ripeding and sensoronce of leaves and flowers e.g. to delay sensoronce and prolong the life of cut flowers or enhance sensoronce of reproductive organs to engineer sterile plants. Other modifications can be used to delay sensoronce in selected cell types or organs providing fruit and vegetables which have a longer shelf life between harvest and consumption, or to decrease branching frequency in forest tree species giving long stretches of valuable Knot-free clear wood which can be used in solid timber furniture and veneers

Determining a predisposition to mental disorders utilizing differential gene expression, useful for diagnosing, and/or treating mood disorders or psychosis, including bipolar and major depression disorders and schizophrenia.

Example 3; SEQ ID NO 24; 85pp; English.

This invention relates to a novel method for determining a predisposition to mental disorders by utilising differential gene expression.

Specifically, it refers to the differential gene expression of brain region specific nucleic acids that can be used to determine a prevalence of mental disorders with a gender bias. Accordingly, it comprises contacting a parients biological sample with a reagent (e.g. antibody) that selectively associates with a polymucleotide given in the specification, and detecting the level of reagent that associates to determine whether the subject has, or is predisposed for, a mental clistorder. As such, the present invention describes a method and disorders, such as psychosis e.g. schizophrenia or a mood disorder including bipolar and major depression disorders. These compositions have aforementioned conditions are the caforementioned conditions are the sequence is a brain specific gene (with gender bias) that is confer. used in an exemplification of the invention.

pBlueScript backbone); Site 1: BamHI; Site 2: BglII; Beschemu is a 4.9 kb, modified maize Mu transposon designed to allow plasmid rescue from total genomic DNA. Mu elements insert preferentially into transcription units. For more information on RescueMu, go to the web site www.rmdb.isstate.edu and follow the links for "RescueMu, Grid I was grown at Berkeley in 2001. DNA was extracted from leaf punches, double digested using BamHI and Bill, and ligated to form circular plasmids. DH10B ampicillin."

/note="Organ: prostate; Vector: pT713D-Pac (Pharmacia)
with a modified polylinker; lst strand cDNA was prepared
from normal prostate bulk tissue, and was then primed with
a Not I - oligo(dT) primer. Double-stranded cDNA was
ligated to Eco RI adaptors (Pharmacia), digested with Not
I and cloned into the Not I and Sto RI sites of the
modified pT7T3 vector. Library is normalized, and was
constructed by Bento Soares and M. Patima Bonaldo. "

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Sequence 7799, Application US/0925291A

Sequence 7799, Application US/0925291A

Patent No. 6551795

GENERAL INFORMATION:

APPLICANT: Marc J. Rubenfield et al.

TITLE OF INVENTION: NUCLEIC ACID AND AMINO ACID SEQUENCES RELATING TO F.

TITLE OF INVENTION: AEMUGINOSA FOR DIAGNOSTICS AND THERAPEUTICS

FILE REFERENCE: 107196.136

CURRENT PILING DATE: 1999-02-18

PRIOR APPLICATION NUMBER: US 60/074,788

PRIOR APPLICATION NUMBER: US 60/094,190

PRIOR PLILING DATE: 1998-02-18

PRIOR FILING DATE: 1998-07-27

NUMBER OF SEQ ID NOS: 33142

SERVICE THE SET OF THE SET OF THE SECOND ACT OF THE SET OF T
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps

Sequence 16564, Application US/09252991A

Patent No. 6551795

GENERAL INFORMATION:
TITLE OF INVENTION: NUCLEIC ACID AND AMINO ACID SEQUENCES RELATING TO PSEUDOMONAS

TITLE OF INVENTION: ARRUGINOSA FOR DIAGNOSTICS AND THERAPEUTICS

TITLE OF INVENTION: ARRUGINOSA FOR DIAGNOSTICS AND THERAPEUTICS

PILE REPERRICE: 107196.136

CURRENT PILING DATE: 1999-02-18

PRIOR APPLICATION NUMBER: US 60/074,788

PRIOR APPLICATION NUMBER: US 60/074,788

Sequence 16454, Application US/09252991A

Sequence 16454, Application US/09252991A

Faten No. 6551795

GENERAL INFORMATION:

APPLICANT: Marc J. Rubenfield et al.

TITLE OF INVENTION: NUCLERC ACID AND AMINO ACID SEQUENCES RELATING TO PSEUDOMONAS

TITLE OF INVENTION: ARRUGINOSA FOR DIAGNOSTICS AND THERAPEUTICS

TITLE OF INVENTION: ARRUGINOSA FOR DIAGNOSTICS AND THERAPEUTICS

CURRENT PAPLICATION NUMBER: US/09/252,991A

CURRENT PAPLICATION NUMBER: US 60/074,788

PRIOR PLING DATE: 1998-02-18

PRIOR APPLICATION NUMBER: US 60/094,190

PRIOR APPLICATION NUMBER: US 60/094,190

PRIOR PLING DATE: 1998-07-27

NUMBER OF SEQ ID NOS: 33142

SEQUENCE: 100 NO 16454
Sequence 6246, Application US/09489039A

Patent No. 6610836
GENERAL INFORMATION:
APPLICANT: GATY Breton et. al
APPLICANT: GATY BRETON NUCLEIC ACID AND AMINO ACID SEQUENCES RELATING TO KLEBSIELLA
TITLE OF INVENTION: PNEUMONIAE FOR DIAGNOSTICS AND THERAPEUTICS
TITLE OF INVENTION: PNEUMONIAE FOR DIAGNOSTICS AND THERAPEUTICS
TITLE OF INVENTION: PNEUMONIAE FOR DIAGNOSTICS AND THERAPEUTICS

Patent No. 6551795

GENERAL INFORMATION

GENERAL INFORMATION: WUCLEIC ACID AND AMINO ACID SEQUENCES RELATING TO PSEUDOMONAS

TITLE OF INVENTION: NUCLEIC ACID AND AMINO ACID SEQUENCES RELATING TO PSEUDOMONAS

TITLE OF INVENTION: NUCLEIC ACID AND AMINO ACID SEQUENCES RELATING TO PSEUDOMONAS

TITLE OF INVENTION: ARRUGINOSA FOR DIAGNOSTICS AND THERAPEUTICS

CURRENT FILING DATE: 1999-02-18

PRIOR APPLICATION NUMBER: US 60/074,788

PRIOR APPLICATION NUMBER: US 60/094,190

PRIOR APPLICATION NUMBER: US 60/094,190
